Experience

Scrawlr Sep 2025 - Dec 2025
Software Engineer, Platform & Infrastructure Vancouver, BC

- Designed, built, and deployed an agentic incident remediation system that autonomously investigated incidents, proposed and validated corrective actions, and executed production changes with engineer approval, reducing MTTR by over 80%.
- Owned and managed the team's AWS infrastructure using Terraform and CI/CD pipelines using GitHub Actions and CircleCI.
- Redesigned CI/CD pipelines and cloud infrastructure to support multiple isolated QA environments, eliminating testing bottlenecks and increasing QA throughput by 50%.
- Led end-to-end development and production delivery of Lodgr's native hosting and property management platform, coordinating frontend, backend, and QA efforts under a tight deadline ahead of an industry convention.
- Integrated Scrawlr OAuth into Lodgr's subdomain-based environments, resolving compatibility issues and establishing the authentication foundation for real-time host-guest messaging.

UKG May 2025 - Aug 2025
Software Engineer, Mobile Platform Toronto, ON

- Refactored legacy Ionic-based mobile modules into reusable iOS and Android components that better support the integration of continuously acquired products into UKG Pro.
- Implemented proxy routing with service-discovery fallback for critical, high-traffic services, replacing repeated discovery requests and relieving load on the service registry.
- Implemented mobile app observability with Splunk dashboards and actionable PagerDuty and Slack alerts, improving visibility into client-side failures and reducing incident response time.
- Rewrote UKG Pro's mobile release pipelines to include building and testing a backup version that is used for rollback submission to the App Store and Play Store, adhering to forward-only versioning requirements.

Metergy Solutions Jan 2024 - May 2025
Software Engineer Markham, ON

- Designed and built an offline-first IoT installation platform end-to-end, with local data persistence and cloud synchronization to SQL databases and file storage when connectivity returned, improving Field Ops efficiency by an estimated 50%.
- Built a backend ingestion service to process device-initiated HTTP uploads, replacing FTP polling and cron-based ingestion and raising reliability from 70% to 99.9% across 10,000+ IoT meters.
- Built an AI OCR pipeline that extracted utility-bill data essential to customer billing, reducing manual processing and routing low-confidence results for human review.
- Modernized business-critical Microsoft Access tools into a Django/Vue platform supporting concurrent team access, improving uptime and reliability, and halving runtime for jobs such as bulk email sending.

Education

University of Waterloo 2021 - 2026
Honours Bachelor of Computer Science, Co-op

Technical Skills

Languages: Python, TypeScript/JavaScript, Java, C#, Go, C++, Kotlin, Swift
Backend and Data: FastAPI, Django, Node.js (Fastify), Spring Boot, PostgreSQL, MySQL, Redis
Cloud and CI/CD: AWS, GCP, Docker, Kubernetes, Terraform, Pulumi, GitHub Actions, CircleCI
AI and Automation: Agentic workflows, Model Context Protocol (MCP), agent skills, tool orchestration
Observability: Sentry, Splunk, Prometheus, Grafana
Frontend and Mobile: React, Vue.js, Ionic Framework, SwiftUI, Jetpack Compose
